

High-resolution characterization of CCA powder particles

Nicolas J. Peter

Eric Gärtner, Volker Uhlenwinkel, Eric A. Jägle, Gerhard Dehm

February 14th, 2018

Particle strengthened Compositionally Complex Alloys

interlinking powder synthesis, additive **manufacturing**, **microstructure evolution and deformation mechanisms**

Powder
Fabrication &
Modification

Selective Laser
Melting

Post Heat
Treatment

Properties

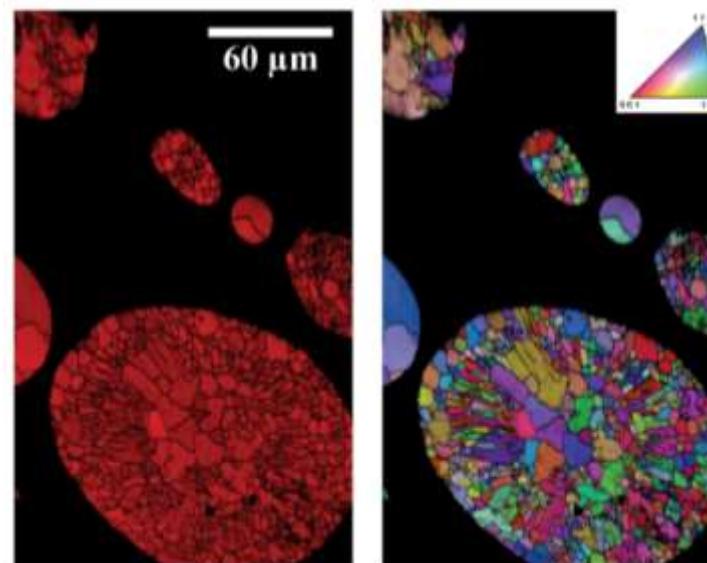

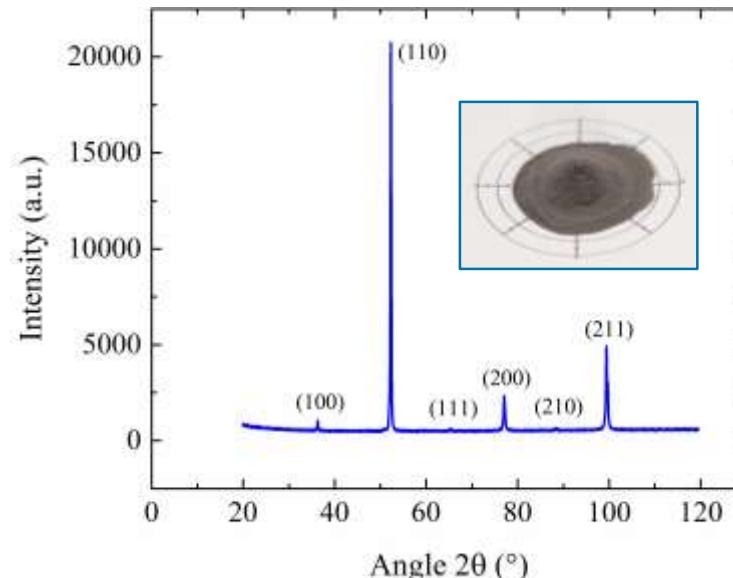

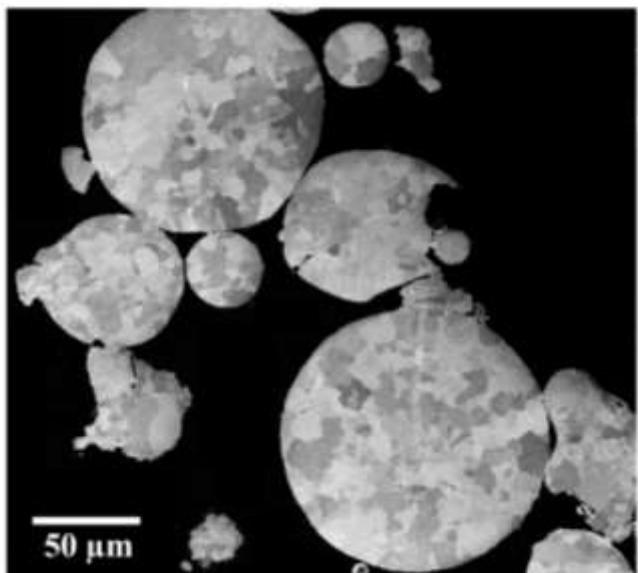

High-Resolution + mechanical characterization

We aim for SLM microstructures determined by the powder

Powder of nominal composition:

Polycrystalline powder particles
XRD and EBSD indicate **B2 single phase**

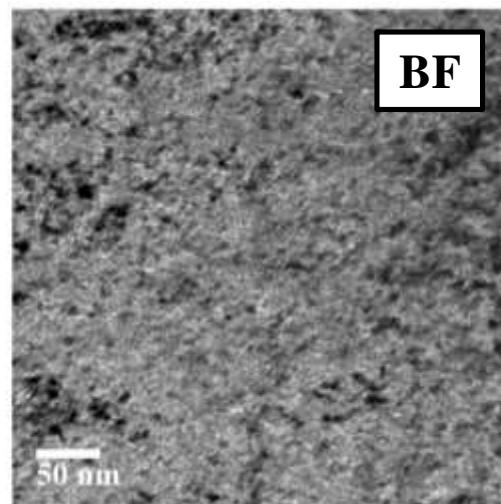

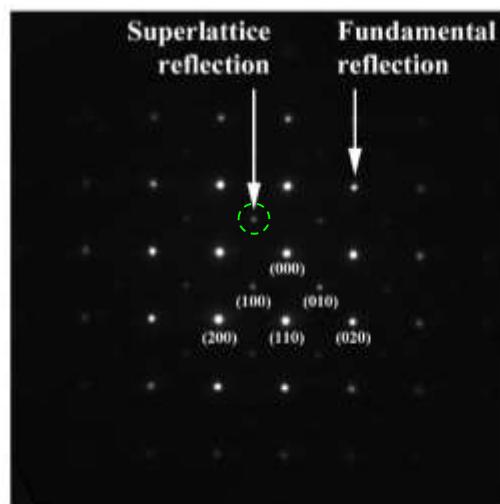

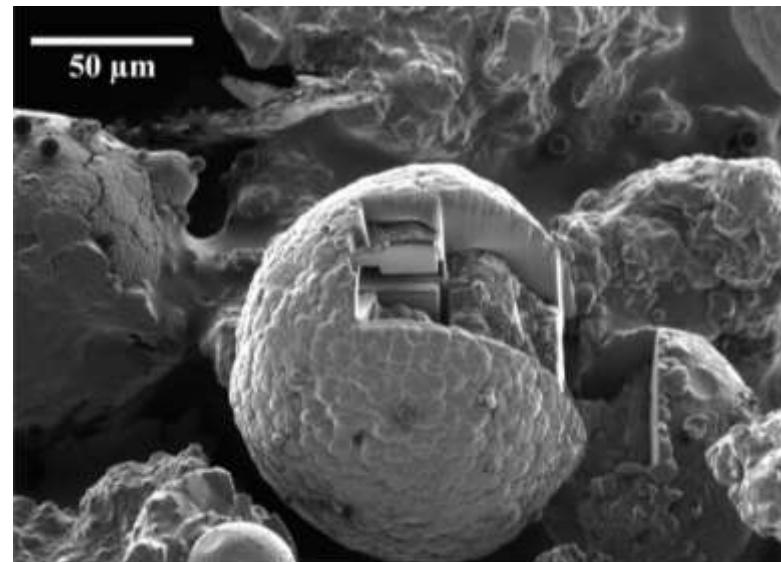

Conventional TEM:

B2 diffraction pattern

Meander-like structure in DF images
with wavelength of 5.78 ± 3.81 nm

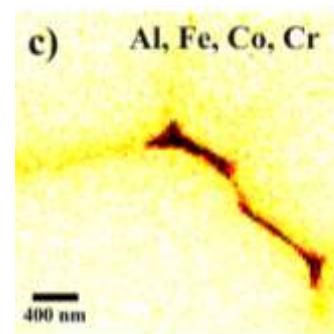

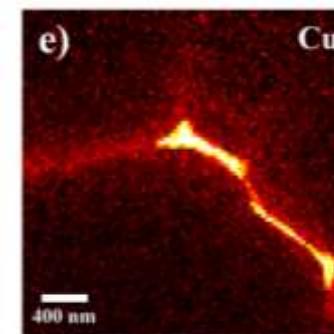

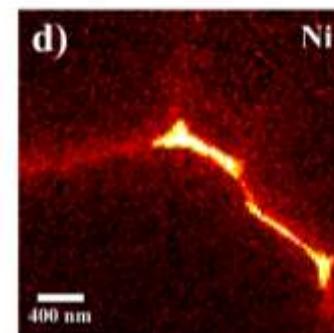

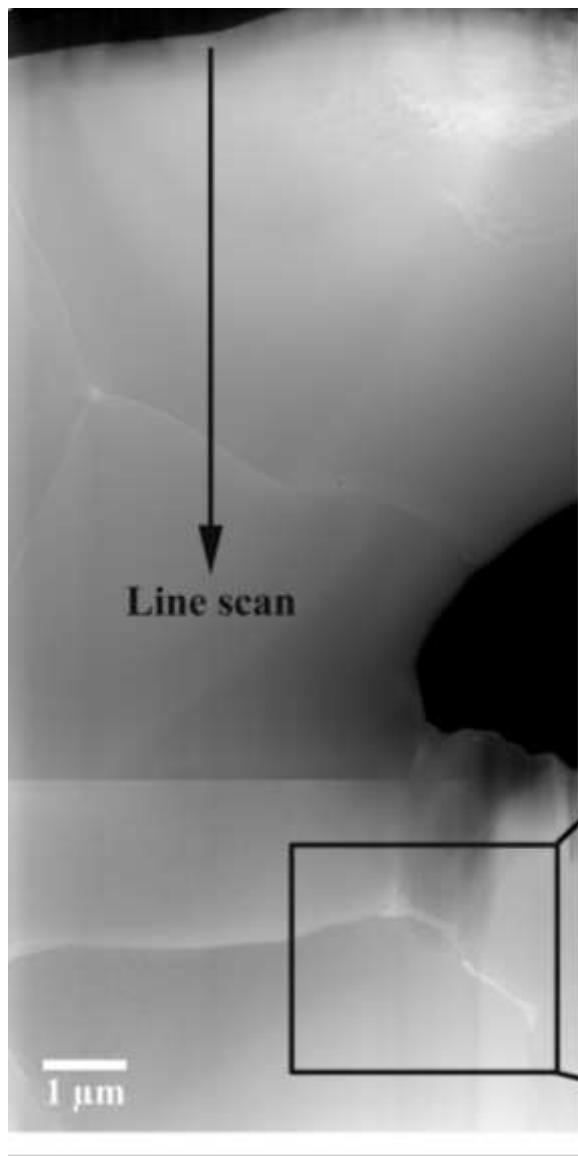

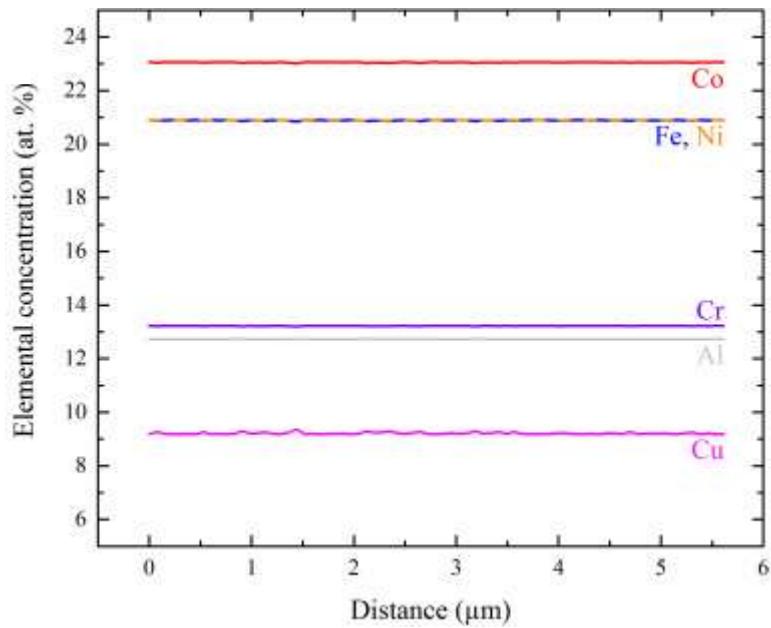

Phase separation?

Chemical composition

EDS of lower magnification:

Homogeneous grain interior &
CuNi-rich grain boundary phase

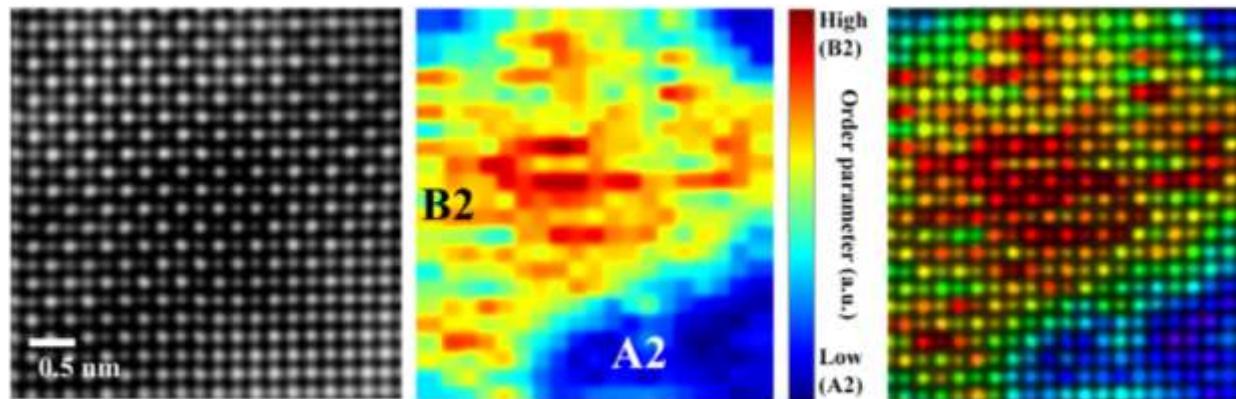

High-resolution STEM

YEARS 1917–2017
100

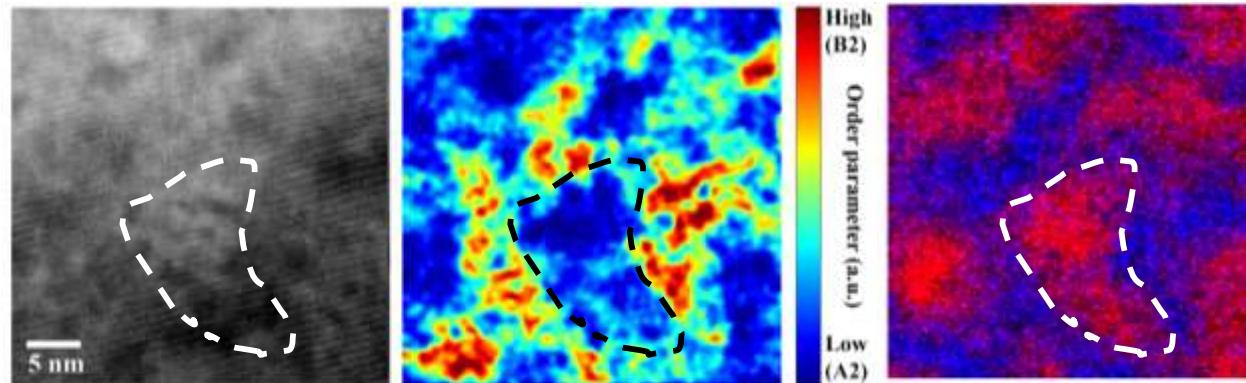

HAADF
STEM
[001]

EDS of higher magnification:

Chemical and structural ordering into A2 / B2 compartments
High coherency

HAADF
STEM
[001]

EDS
STEM
A2 / B2

Atom probe tomography

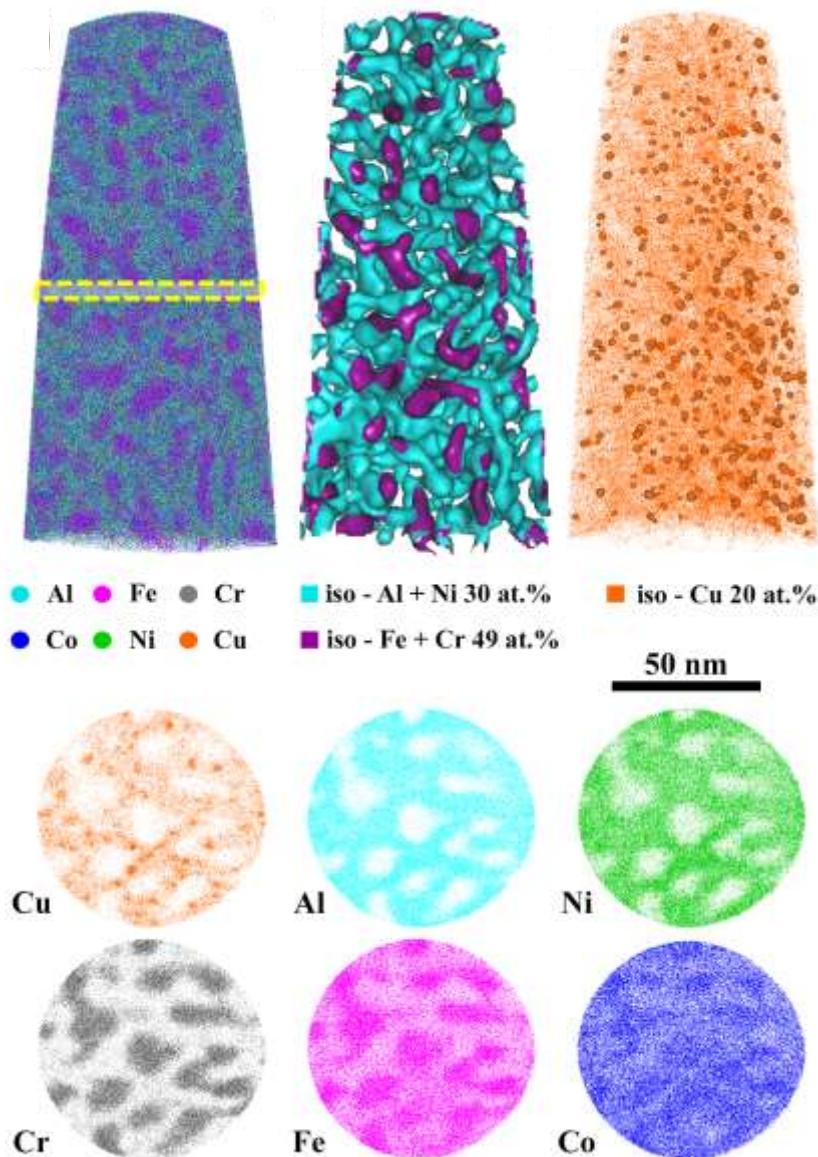

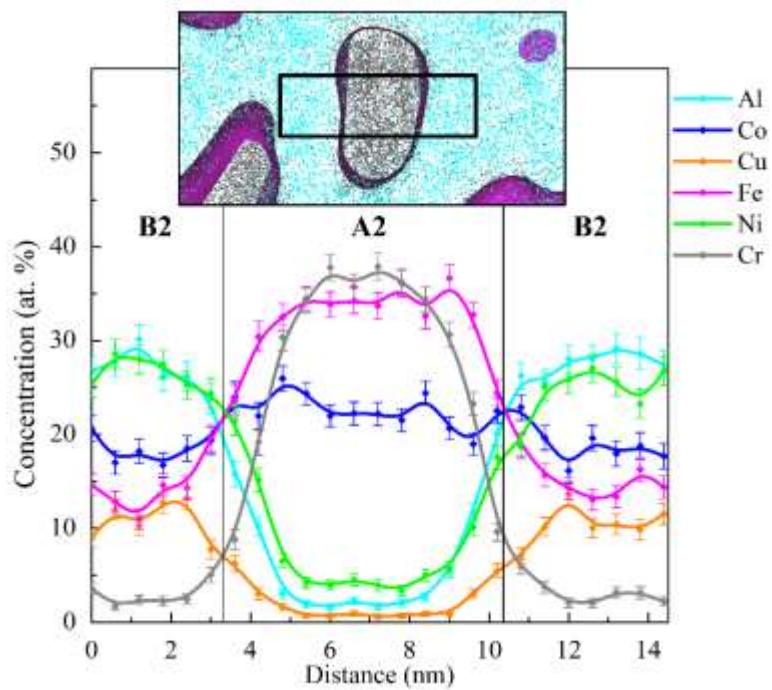

YEARS 1917-2017
100

3D-APT:

Phase composition of
interwoven A2 / B2 regions

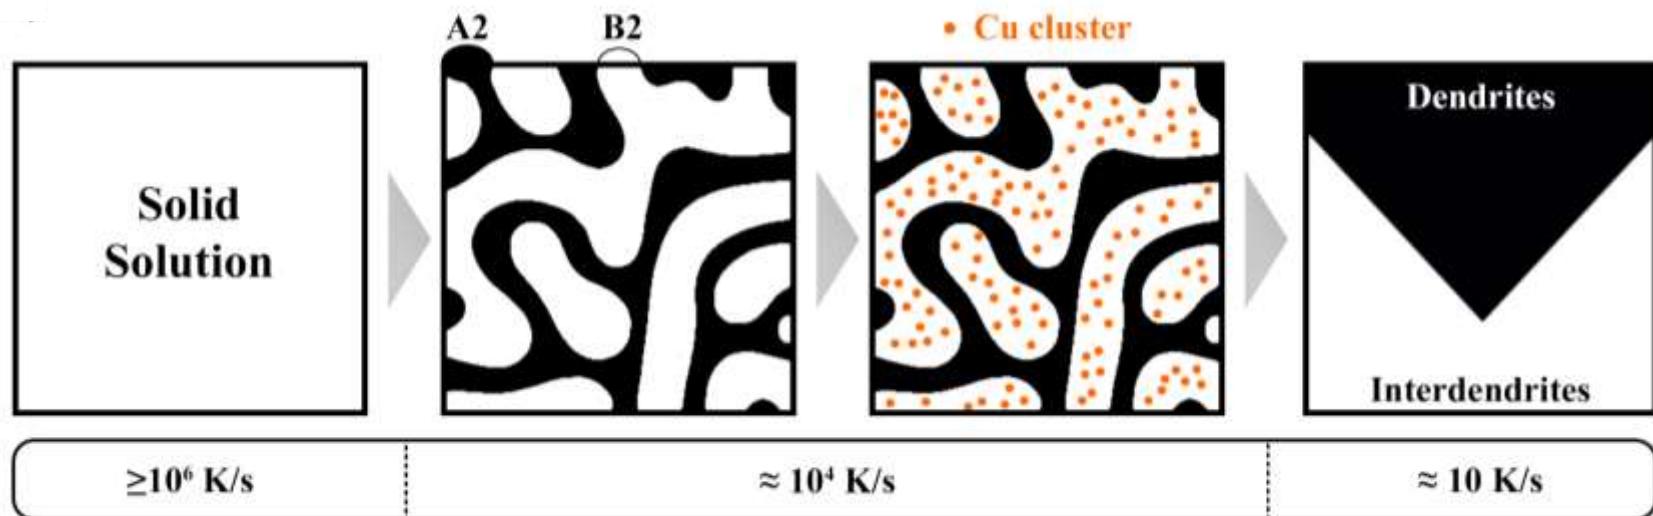

High Cu cluster density in B2 phase

What do we learn?

Cooling rate and alloy composition ($\text{AlCu}_{0.5}\text{NiFeCoCr}_{0.75}$) allow for
Extension of phase evolution model

Conditional spinodal decomposition (A2 / B2) & nucleation & growth (Cu clusters)

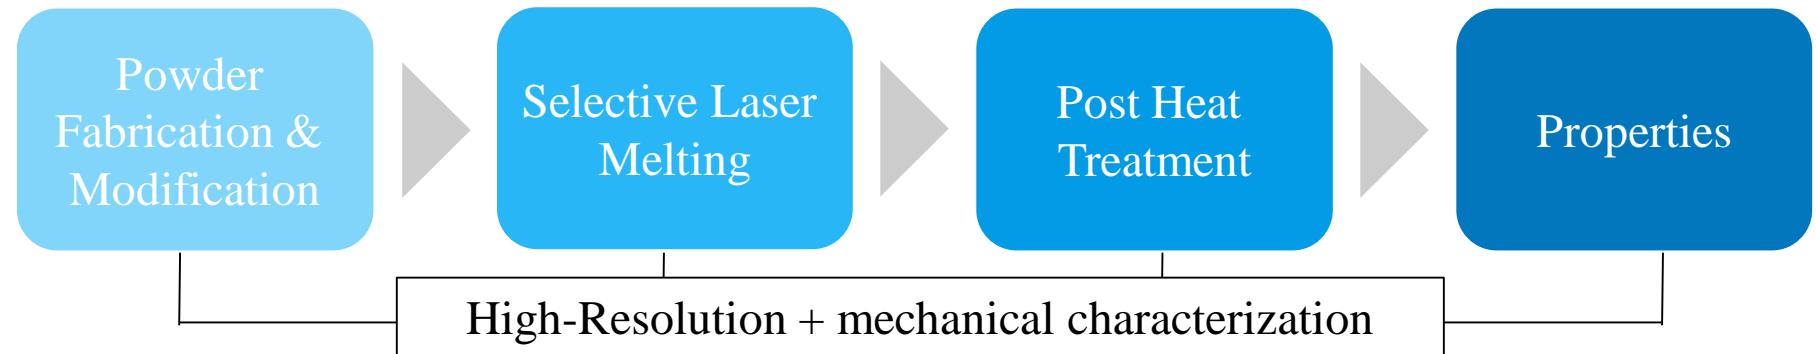

S. Singh et al. (2011)
M.V. Ivchenko (2016)

Cooling rate / Phase evolution

S. Singh et al. (2011)
M.V. Ivchenko (2016)

How do we proceed?
